| Description           | Release of the annual Risk Management File Review documenting evaluation of the current Process FMEA (PFMEA) against quality data from the review period. The review confirmed no complaints, no CAPAs, and one isolated supplier-related nonconformance with no linkage to internal process failures. The assessment concludes that existing PFMEA failure modes and controls remain appropriate and no updates to the risk file are required. |

| QMS Impacted?             | No                                                                                                                                                                                                                                                                                            |
| Medical Device Impacted?  | Yes                                                                                                                                                                                                                                                                                           |
| Regulatory Impact Details | No regulatory impact. This activity fulfills routine risk management review requirements in accordance with ISO 14971 and internal procedures, with no changes to product design, manufacturing processes, or validated states. No impact to regulatory submissions, filings, or commitments. |

Additional Assessment

|                    |                                                                                                                                                                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Material affected? | No                                                                                                                                                                                                                                                                   |
| Risk Assessment    | No new or increased risks identified. The single nonconformance was isolated to a supplier-related issue and does not indicate a breakdown in internal process controls. Existing PFMEA controls remain effective, and the risk profile of the process is unchanged. |
| Change Owner       | Aaron Rogers                                                                                                                                                                                                                                                         |

## 1.0 PURPOSE

To provide the results of the risk management production and post-production review for the SILQ 2-way Cleartract Foley Catheters.

## 2.0 SCOPE

This review applies to the SILQ catheter for the period of March 2025 to Feb 2026:

## 3.0 RESULTS & DISCUSSION

### 3.1 Complaints

3.1.1 Zero (0) complaints were reported for the time period indicated.

### 3.2 Nonconforming Product

3.2.1 One (1) non-conformance reports occurred, which are indicated in the following table:

**Table 1: NCR Summary**

| NCR No | Part No       | NCR Description                                                                                                                                             |
|--------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 25-079 | SLQ-211610SPT | Two lots of finished goods are suspected of containing devices where the check valve (Item no. 5) assembly fails to meet the specified acceptance criteria. |

#### 3.2.1 Analysis of Non-Conformances:

| NCR No. | Root Cause                        | # / PFM                            | Risk Controls        | Change Required (Yes/No)? |
|---------|-----------------------------------|------------------------------------|----------------------|---------------------------|
| 25-079  | Code 605 – Supplier Quality Issue | 6 / Accept Non-Conforming Material | Process Instructions | No                        |

RMF: RM-0021 rev F, PFMEA

3.2.1.1 One nonconformance was identified during the review period and was attributed to a supplier-related issue external to internal manufacturing processes. An assessment was performed to determine whether the failure mechanism could be linked to internal process risks; no such linkage was identified. The event aligns with risks managed under the client's Design FMEA and supplier quality controls rather than the Process FMEA. Based on this evaluation, the current Process FMEA remains adequate and no updates were required. Existing supplier oversight and incoming controls were reviewed and deemed appropriate.

### 3.3 Corrective Action

3.3.1 There were zero (0) CAPAs opened during this period associated with the finished device.

## 4.0 CONCLUSION

No complaints or CAPAs were identified during the review period, and a single nonconformance was recorded. The nonconformance was determined to be an isolated supplier-related issue with no linkage to internal process failures or breakdowns in process controls. Evaluation against the Process FMEA confirmed that existing failure modes and controls remain appropriate, with no indication of gaps or unmitigated risks. Based on the absence of adverse trends and the isolated nature of the event, the current risk management file remains adequate and up to date, and no updates are required at this time.
